

Event Management Platform – Requirements

Prepared for: Nexora Events Group

Version: 0.3 (DRAFT)

Date: June 2026

Prepared by: Sarah M., Solutions Team

1. Client Overview

Nexora Events Group is a mid-sized event management company based out of Austin, TX. They currently manage somewhere between 200-300 events per year (exact number TBD – Marcus from their ops team is checking). Their main verticals are corporate conferences, product launches, and what they describe as "hybrid" events that mix in-person and virtual attendance. They've been using a mix of Eventbrite, spreadsheets, and a custom-built internal tool that nobody really wants to maintain anymore.

Primary contact: Marcus Webb, Head of Operations (marcus.webb@nexoraevents.com). Secondary contact is probably Jamie Okafor on the tech side but we haven't confirmed that yet.

[TBD] *Get final headcount for their team – they said around 45 staff but that might not include contractors.*

They want the new platform live by Q4 2026. Actually, in the last call Marcus mentioned end of September which conflicts with what their CEO said in the intro email about "early next year". Need to clarify timeline before we go too far down this road.

2. What They're Trying to Do

The core ask is a unified platform that handles everything from initial event setup through post-event reporting. Right now their teams are jumping between 4-5 different tools and data gets lost. They also mentioned wanting better attendee management but when we asked for specifics they said that was more of a "nice to have" vs the core registration flow which is a must-have.

High level goals they called out:

- Single platform for event creation, ticketing, and attendee management
- Real-time dashboard showing registrations, check-ins, revenue
- Integration with their existing CRM (Salesforce) – this is non-negotiable per Marcus
- Mobile app for on-site staff (iOS at minimum, Android would be nice)
- Automated email/SMS communications to attendees
- Support for both free and paid events with multiple ticket tiers

[TBD] *Ask whether they need white-labeling or if Nexora branding on the platform is acceptable.*

3. Functional Requirements

3.1 Event Creation & Management

Users should be able to create new events with all the standard stuff – title, description, date/time, venue info, capacity limits. They want the ability to clone previous events as a starting template which apparently saves them a lot of time. Events should support multiple sessions/tracks (especially important for their conference use-case).

There was some discussion about whether events should have an "approval" workflow before going live or if organizers can publish directly. Marcus said he wants organizers to publish immediately without approval. Their CEO said in a separate conversation that everything should go through an admin review first. We need to get these two aligned.

[TBD] *Confirm: does the platform need to support recurring events (e.g., monthly meetups)?*

3.2 Registration & Ticketing

Registration flow needs to be simple. Attendees fill out a form, pick their ticket type, pay if applicable, and get a confirmation email with a QR code. The form fields should be customizable per event – some events just need name and email, others need dietary preferences, company name, job title, etc.

Ticket types discussed: General Admission, VIP, Early Bird, Sponsor/Comp. Early Bird pricing should automatically switch to regular pricing after a set date or when the allocation runs out, whichever comes first.

Payment processing – they want Stripe. They also mentioned PayPal but then said "actually probably just Stripe is fine." We can start with Stripe and add more later.

- Support promo/discount codes (percentage and fixed amount)
- Waitlist functionality when event is at capacity
- Attendees can transfer their ticket to someone else (self-service)
- Refunds – policy is configurable per event, system processes refunds automatically

[TBD] *Group registration (e.g., company books 10 seats at once) – is this in scope for v1?*

3.3 Check-in

On the day of the event, staff use the mobile app to scan QR codes and check people in. Pretty standard stuff. They want offline support so if the venue WiFi is spotty things don't grind to a halt. Data should sync when connectivity is restored.

They also mentioned wanting a walk-up registration option at the door but noted this is lower priority. Would still need to accept payment on-site in that case – card reader integration (Square?) is probably the way to go but this is all TBD.

3.4 Communications

Automated emails: registration confirmation, reminder (configurable – e.g., 7 days before, 1 day before), post-event thank you/survey. All emails should be customizable with the event branding.

SMS reminders were requested but honestly this might be v2 material. Keep it in the backlog for now.

They want to be able to send ad-hoc emails to all registered attendees or segments (e.g., just VIP ticket holders). This is essentially a light email marketing feature. Need to think about whether we build this or integrate with something like Mailchimp.

[TBD] Clarify: do they need transactional email to come from a Nexora-branded domain? Will need SPF/DKIM setup.

3.5 Reporting & Analytics

Real-time dashboard showing: total registrations, check-ins on event day, revenue breakdown, ticket type breakdown. After the event they want a summary report they can export to PDF or Excel.

There was also a request for "predictive" analytics to forecast attendance. This seems out of scope for now but flagging it.

4. Non-Functional / Technical Stuff

The platform should be web-based, accessible from any modern browser. No IE support obviously. Mobile responsive for attendee-facing pages.

Scale: their largest event so far had ~3,000 attendees. They'd like the system to handle up to 10,000 for a single event without issues. We should probably stress test this before launch.

They are very concerned about data privacy (GDPR and CCPA compliance mentioned). All attendee data should be encrypted at rest. They want the ability to delete all data for a specific attendee on request.

Uptime: "we need this to be rock solid" – we should aim for 99.9% uptime SLA but haven't committed to anything formally yet.

[TBD] What's their hosting preference? Cloud (AWS/GCP/Azure)? Do they have an existing cloud vendor relationship?

[TBD] SSO / SAML integration for staff login – they use Okta internally. Probably needed but not confirmed.

5. Integrations

Confirmed integrations needed:

- Salesforce CRM – sync attendee/contact data, push event registrations as Salesforce activities
- Stripe – payment processing
- Zoom / Teams – for virtual/hybrid events, auto-generate meeting links and include in confirmation emails

Nice to have / under discussion:

- Mailchimp or similar for email marketing

- Slack notifications for the internal team (e.g., alert when registration milestones hit)
- Zapier/webhook support for custom automations

[TBD] *Their current internal tool exports data as CSV – do we need a one-time data migration of historical events?*

6. Open Issues / Things to Resolve

Tracking these here because they came up during discovery but we don't have answers yet:

- **Timeline conflict:** Marcus says Sept 2026, CEO email says early 2027. Need exec alignment before we scope sprints.
- **Approval workflow:** Marcus wants direct publish; CEO wants admin review. Contradictory – needs stakeholder decision.
- **Mobile app scope:** iOS confirmed. Android unclear. Native vs. PWA not decided.
- **White labeling:** Not discussed yet. Could be significant scope if they want per-client branding.
- **v1 vs v2 scope:** Group registration, SMS, predictive analytics – all floated but not committed. Need a prioritized feature list signed off.
- **SLA / support model:** They asked about 24/7 support for event-day issues. We haven't scoped a support plan.
- **Pricing model:** They expect SaaS pricing but haven't discussed per-event vs. per-seat vs. flat monthly. TBD.

7. Miscellaneous Notes

These came out of the discovery calls and I didn't want to lose them:

Marcus mentioned they had a bad experience with a previous vendor who over-promised on integrations. He's going to be watching the Salesforce sync closely. Worth flagging this to the dev team early.

The internal tool they're replacing was built by a contractor who is no longer available, so there's no documentation and nobody really knows how it works. Data migration might be messier than expected.

Jamie (their tech contact) mentioned they might want an API so they can build internal tools on top of the platform eventually. Not a v1 requirement but good to keep in mind for architecture decisions.

They host some events internationally (UK and Canada mentioned). Currency support and timezone handling needs to be correct. Also potential tax implications for paid events in different jurisdictions – probably not our problem to solve but should be documented.
